

LOT® Computer

Owner's Manual — v1.0 Pilot Unit

A flat stainless steel terminal for one message at a time, from your LOT® account.

brand.lot-systems.com · 40mm x 40mm x 6.8mm · 316L stainless steel

What This Is

LOT® Computer is a flat stainless steel terminal that sits on your desk and shows you exactly one thing, at exactly the right moment: a short line of text from your LOT® account. No app to check. No feed to scroll. When there is nothing to say, the screen is dark.

IN THE BOX

- LOT® Computer unit (40mm x 40mm x 6.8mm, 316L stainless steel)
- LOT® Plinth wireless charging base
- USB-C cable (charges the Plinth, not the unit directly)
- This manual

SETUP

1. Place the unit polished-side-down on the LOT® Plinth. A single LED ring lights briefly to confirm it is charging.
2. On your phone or computer, sign in to your LOT® Usership account and go to lot-systems.com/computer/setup.
3. Follow the on-screen pairing steps. Under two minutes, and only needed again if you change WiFi networks.
4. Once paired, place the unit anywhere on your desk within WiFi range.

Using It

THE SCREEN

Shows a short message when your LOT® account has something for you — a routine reminder, a weather note, a badge — and returns to dark on its own after a few seconds. It is not a clock. Nothing is lost if you miss it; anything important is also in your LOT® account when you next open it.

THE COPY BUTTON

Press it while a message is showing, and that message is saved to your Log tab on lot-systems.com — automatically, with no typing. Press it when nothing is showing, and nothing happens. It has exactly one job.

CHARGING

Set it on the LOT® Plinth. A full charge from empty takes roughly 1.5-2 hours (measured target). Typical use between charges is several days.

ABOUT THE CAMERA

LOT® Computer has a small camera on the same face as the screen, used for exactly one thing: telling whether someone is currently in front of the unit, so a message is timed to when you're actually there.

- The camera never sends a picture anywhere. Every frame is turned into a single yes/no answer on the device itself and discarded in the same instant — there is no path in the device software connecting the camera to the WiFi radio (see [docs/technical/LOT-COMPUTER-FIRMWARE.md](#), Section 03, for engineers).
- The only thing that ever leaves the device because of the camera is one word — "present" or "not present" — timestamped, the same as a motion sensor would report.

Care

- Wipe with a soft cloth. The polished face is bare stainless steel, not coated — fingerprints are normal, not a defect.
- Rated for dust and light splashes (IP54 target). Not for submersion, dishwashers, or the shower.
- No user-serviceable parts inside. The two-part shell is sealed at the factory; opening it voids the pilot-unit warranty.

Technical Notes (Pilot Unit, v1.0)

Dimensions	40mm x 40mm x 6.8mm (see Hardware Plan S04.4 for the 5mm target vs. 6.8mm shipped)
Material	316L stainless steel, two-part construction
Display	1.28" round, 240x240
Connectivity	WiFi 802.11 b/g/n, Bluetooth LE (setup only)
Charging	Qi-class wireless, via LOT® Plinth
Battery	~350-400mAh, several days typical use
Sensors	Temperature, humidity, pressure, VOC/air quality, motion/orientation, presence
Certification	FCC/CE and UN38.3 in progress for this pilot batch — not yet general retail sale

SUPPORT

For setup help or questions about your pilot unit, use the same support channel as your Usership account at lot-systems.com.
