

COSMO® Cube — User Manual

A quiet notification companion for your LOT® profile.

What's in the box

- 1x COSMO® Cube (stainless steel, two-part shell)
- 1x Charging Plate (40mm x 40mm silver plate)
- 1x USB-C charging cable
- This manual

Meet your Cube

The Cube has two faces:

- **The mirror face** — polished stainless steel. This is the resting face. When your Cube isn't telling you anything, leave this side up.
- **The active face** — a small round screen, a camera, and a single button labeled **COPY**. Turn the Cube to this side when you want to read a notification or use the button.

There is no power switch, no speaker, and no app to install on the Cube itself. Everything happens through your existing LOT® account at lot-systems.com.

Setting up your Cube

1. Place the Cube on the Charging Plate. The plate's edge light will pulse gently while it charges.
2. On your phone or computer, open lot-systems.com/hardware.
3. A pairing code will appear on screen. Turn your Cube to the active face and hold it toward the code — the camera reads it in about a second.
4. Once paired, the screen shows a short confirmation, then goes quiet.

Your Cube is now yours.

A Cube only ever belongs to one LOT profile at a time. You can unpair it at any time from lot-systems.com/hardware — this is instant and cannot be undone remotely, so re-pairing requires the physical Cube again.

What your Cube does

Your Cube receives short messages from your LOT® Memory Engine — the same system that already asks you thoughtful questions in the app. When it has something worth telling you, the screen lights up with a short message, for example:

> Coffee time!

That's it. No feed, no scrolling, no unread badge piling up. If you miss it, it will still be there — reflected in your Log — but the Cube itself does not nag.

The COPY button

Press **COPY** at any time. Whatever the Cube last showed you is saved straight into your **Log** on lot-systems.com — the same place your journal entries live. Think of it as a physical bookmark: a message that mattered enough to press a button for is a message worth keeping in your own record.

If the screen is quiet when you press COPY, your Cube simply notes that you were present — a small, honest "I was here" entry.

Charging

Set the Cube on its plate whenever you're not using it — there is no harm in leaving it there overnight. A full charge from empty takes a few hours. The plate's edge light tells you what's happening:

- **Slow pulse** — charging

- **Steady** — fully charged
- **Off** — not connected to power, or no Cube present

The weather sensor

Your Cube quietly reads the temperature, humidity, and air pressure of the room it sits in. This shows up on your LOT profile the same way weather already does today, just measured where you actually are instead of the nearest weather station.

Care and cleaning

- The mirror face is polished stainless steel — a soft microfiber cloth keeps it bright. Avoid abrasive cleaners.
- The active face is matte-finished on purpose — do not polish it.
- The Cube is splash-resistant, not waterproof. Keep it away from standing water.

Privacy, in plain terms

- The camera only ever turns on during pairing. It is not a security camera and does not record or send video.
- The microphone listens only for a wake cue on the device itself — raw audio never leaves the Cube.
- Everything the Cube reports becomes part of your own Memory Story, under your own account, the same privacy rules that already govern the rest of your LOT profile (README, "Your Story, Your Data") — you can export or delete it at any time.

Troubleshooting

Symptom	Try this
Screen never lights up	Confirm the Cube is charged and paired at lot-systems.com/hardware
COPY button doesn't seem to save anything	Check your Log tab directly — entries appear there, not on the Cube
Plate light doesn't turn on	Check the USB-C cable and power source
Need to give the Cube to someone else	Unpair it first at lot-systems.com/hardware , then pair it again on their account
